

# REVIVAL DERMATOLOGY

## Post Procedure Instructions

### ED&C POST-CARE

- It is very important to take care of your now-treated skin cancer site so that any scarring can be minimized.
- Please keep the area clean with soap and water twice daily. A man made scab has already been made over the area and care must be taken to not allow this scab to thicken. Use hydrogen peroxide on a wet wash cloth and dab the area gently twice daily.
- Keep the area MOIST with vaseline or Aquaphor healing ointment and covered with a bandaid if possible. If you can't cover it with a bandaid, make sure you are applying sunscreen.
- If there is any increasing redness, pain, swelling or yellow discharge please call the office.
- Ensure that you have already scheduled your 6 month skin check. If you have any concerns with how the lesion is healing prior to that appointment, please call the office.
