

Post Procedure Instructions

Halo Laser Post-Care Instructions

The Halo fractional treatment creates outcomes based on the aggressiveness of the treatment taking into account your skin concerns, the health of your skin and your individual healing ability. Due to this, patient response can vary after a Halo fractional treatment. Erythema (redness) and possibly edema (swelling) are the desired responses within a few minutes after the completion of the procedure. The degree of redness and length of healing time will increase with the depth and coverage of the procedure.

Post Treatment

- Redness is normal and expected. Redness generally increases in intensity the first few days after treatment with day 3 being most intense. Redness can persist for up to 7 days depending on the aggressiveness of the treatment.
- Pinpoint bleeding may occur. This can last for a few hours - 12 hours depending on the treatment depth and may be isolated to certain treated areas.
- Immediately after treatment, swelling is common and expected. Use of a cold compress or ice packs will help to relieve the swelling. To avoid further swelling, you may choose to sleep in an upright position the first night after the treatment. The first morning post treatment is when swelling is more prevalent, especially under the eyes. Swelling may last 2-4 days depending on the aggressiveness of the treatment.
- The treated area may be extremely warm for 12-24 hours after the treatment. Cold compresses or ice packs may provide comfort during this time.
- On the 2nd or 3rd day after treatment, you will increasingly notice tiny dark spots and bronzed appearance to the treated skin. These are called MENDS (microscopic epidermal necrotic debris). In individuals with heavily pigmented skin, or in areas where sun damage has produced pigmented lesions, the microscopic wounds, known as MENDS, contain large amounts of melanin. Because there are so many MENDS, they can make the skin look bronzed and small areas appear crusted (do not try to scratch them off). This is part of the healing process where treated tissue is working its way out of your body as new fresh skin is regenerated. During this time, your skin will be very dry and have a sandpaper texture and will begin to flake and peel. If the face is treated, it could take 5-7 days for the peeling process to be completed. If the neck, chest or anywhere on the body was treated, this process could take up to 2 weeks.
- After the peeling process is complete, your skin will have a rosy, pink glow that will gradually resolve.
- If an antiviral was prescribed for you, continue to take it as directed. If you have a history of cold sores and haven't been prescribed an antiviral, please let us know.
- Post treatment discomfort may be relieved by over the counter oral pain relievers; i.e. Extra Strength Tylenol or prescribed pain medication if ordered by the doctor.

REVIVAL DERMATOLOGY

Post Procedure Instructions

- Itching may be experienced during the healing phase and is completely normal. Oral Benadryl may help itching but can cause drowsiness. DO NOT scratch the treated area as scarring and pigmentation complications can occur.

Post Care

- Immediately after treatment, your clinician will apply Alastin Nectar to the treated area. If you wish to minimize your downtime and optimize your results from the laser treatment, it is recommended to apply this product twice daily.
- Cleanse the skin two times a day with plain, lukewarm water and a gentle cleanser beginning the morning after the treatment. Use your hands to gently apply the cleanser and water and finish by patting dry with a soft cloth. DO NOT rub, scrub, use an exfoliant or a skin care brush e.g. Clarisonic in the treated area. Doing so could result in scarring and pigmentation complications.
- Moisturizer should be applied generously over the treated area and reapplied whenever your skin feels dry. For severe dryness, add Aquaphor or Cerave Healing Ointment on top of your moisturizer.
- Peeling and flaking generally occur within 24 hours post treatment and should be allowed to come off naturally. DO NOT PICK, RUB, OR FORCE OFF ANY SKIN DURING THE HEALING PROCESS, THIS COULD RESULT IN SCARRING, PIGMENTATION COMPLICATIONS AND INFECTION! Gently washing the skin more frequently will help to promote the peeling process.
- Sunscreen is a MUST and should be used daily beginning the day of treatment and used vigilantly for up to 3 months post procedure. Use recommended sunscreen with broadband protection (UVA and UVB) and a sun protection factor (SPF) of 30. Apply sunscreen 20 minutes before sun exposure. Reapply sunscreen every 2 hours. If direct sun exposure is necessary, wear a hat and clothing that covers the treated area. If treated area is exposed to sun (direct or indirect) blistering, scarring, hyperpigmentation or hypopigmentation can/will occur. Sun exposure should be avoided for 2 months post treatment.
- Typically, after the peeling process is complete, make up can be worn.
- When showering in the next few days, be sure to avoid getting shampoo directly on the treated area. You may consider taking your shower with the back of your head to the water to avoid directly hitting your face with the full force stream of the water.
- Avoid strenuous exercise and sweating until after skin has healed.

Warning

There may be some degree of swelling immediately post treatment; however, if you have excessive swelling or any of the following signs of infection, you should contact the office immediately at 214-675-3227 during business hours.

Signs of infection include:

- Drainage – looks like pus
- Increased warmth at or around the treated area
- Fever of 101.5 or greater
- Extreme itching or tenderness
